IT INDUCES THE CONTRACTION OF SMOOTH WUSCLE, INCREASES VASCULAR PERMEABILITY AND CAUSES HISTAMINE RELEASE FROM MAST CELLS AND BASOPHILIC LEUKOCYTES. GSA ALSO STIMULATES THE LOCOMOTION OF POLYMORPHONUCLEAR LEUKOCYTES (CHEMOKINESIS) AND DIRECT THEIR MIGRATION TOWARD SITES OF INFLAMMATION (CHEMOTAXIS).
SUBUNIT: C5 PRECURSOR IS FIRST PROCESSED BY THE REMOVAL OF 4 BASIC RESIDUES, FORMING TWO CHAINS, BETA & ALPHA, LINKED BY A DISULFIDE BOND. C5 CONVERTASE ACTIVATES C5 BY CLEAVING THE ALPHA CHAIN, ALPHA

"Nucleotide sequence of the Japanese isolate of pepper [Capsicum annuul mild mottle tobamovirus ("WV-P) RNA.";
Ann. Phytopathol. Soc. Jpn. 63:373-376(1997).
-!- FUNCTION: INVOLVED IN TRANSPORT OF THE VIRUS FROM THE INITIALLY INFECTED CELLS TO ADJACENT CELLS, POSSIBLY BY MODIFYING THE FUNCTION OF THE PLASMODESMATA. ALSO INFLUENCES LOCAL LESION.
DEVELOPMENT. BINDS TO SINGLE-STRANDED NUCLEIC ACID.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                SUBCELLULAR LOCATION: NUCLEAR.

MISCELLAMEDUS: IN EURARYOTES THERE ARE FIVE DNA POLYMERASES:
ALPHA, BETA, CAMMA, DELTA, AND EPSILON WHICH ARE RESPONSIBLE FOR
DIFFERENT REACTIONS OF DNA SYNTHESIS.
MISCELLAMEDUS: CONSERVED REGIONS II, IV, III AND I ARE THOUGHT TO
BE INVOLVED IN SUBSTRATE RECOGNITION, BINDING OR PP(I) HYDROLYSIS:
SIMILARITY: BELONGS TO DNA POLYMERASE TYPE-B FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ween the Swiss institute of Bioinformatics and the EMBL outstati

"Identification and characterization of lef-1, a baculovirus gene involved in late and very late gene expression.";
J. Virol. 67:3481-3488(1993).
-!- FUNCTION: CATALYZES THE TRANSFER OF GLUCOSE FROM UDP-GLUCOSE TO ECTYSTEROIDS WHICH ARE INSECT MOUTING HORMONES. EXPRESSION OF EGT INTERFERES WITH NORMAL INSECT DEVELOPMENT AND BLOCK MOLTING.
-!- SIMILARITY: BELONGS TO THE UDP-GLYCOSYLTRANSFERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      O'Reilly D.R., Miller L.K.;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

GENERAL INFORMATION:
APPLICANT: Sanderson, Sam D.
APPLICANT: Shandard. Simon A.
APPLICANT: Sheman, Simon A.
APPLICANT: Sheman, Simon A.
APPLICANT: Taylor, Stephon M.
TITLE OF INVENTION: High Affinity Response-Selective
TITLE OF INVENTION: CTerminal Analogs of C5a Anaphylatoxin
NUMBER OF SOUGHES: 37
CORRESPONDENCE ADDRESS:
ADDRESSEE Dann, Dorfman, Herrell and Skillman
STREET, 1601 Market Street Suite 720
COUNTRY: PAL CAPPORT OF COMPALIANE
STATE: PA
CONPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: BW PC Compatible
OPERATIOS SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30
CURRENT APPLICATION NOTA:
APPLICATION NUMBER: 36,252
RECISTRATION NUMBER: 36,252
REFERENCE/DOCKET INFORMATION:
NAME: Reed, Janet E.
RECISTRATION NUMBER: 36,33-4100
TELEPHONE: (215) 563-4404
TELEPHONE: (215) 563-4404
INFORMATION FOR SEQ ID NO: 13:
SEQUENCE CHARACTERISTICS:
LENGTH: 10 amino acid
STRANDEDMESS: NO
ANTICATION: TREEVANT
MODEULE TYPE: PEPTING
MAIN CANTON: TREEVANT
MODEULE TYPE: PEPTING
MAIN CANTON: OC TELEVANT
MODEULE TYPE: PEPTING
MAIN CANTON: ANTI-SENSE: NO
PRAMINE: NO
PRAMINE: C-CLEMINAL

                                                                                                                                                                                                                                                                                                                                                                                   C5a C-terminal peptide analogues AAR89734-44 and AAR90033-35 may be u in a mew method for identifying C5a agonists/Antagonists. AAR89734 represents the generic formula of this newly defined class of labelled peptides. C5a antagonists identified using this method are useful in the treatment of a wide variety of C5a-mediated diseases such as acute respiratory distress syndrome (ARDS), anaphylactic shock, psoriasis, osteoarthritis, rheumatoid arthritis, asthma, cardiovascular disorders, and metastatic spread of cancerous tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or
                                                                                                                                                                                                            CSa receptor binding assays - used for identifying cpds.having CSa antagonist, agonist or partial agonist activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New proteins that bind specifically to receptors in the gastro-intestinal tract and related nucleic acid - chimaeras and antibodies, used to deliver therapeutic or diagnostic agents to, through, the gastrointestinal tract, e.g. insulin or leuprolide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .;

This sequence represents a perture that specifically to at least one of the gastro-intestinal (GI) that bind specifically to at least one of the gastro-intestinal (GI) tract receptors human intestinal peptide-associated transporter (HPTI), hereTI, D2H and human sucrose-isomaltase complex (hSI). (I) provide active transport of therapeutic agents through human and animal GI tissue (into the blood) for in vivo delivery, particularly for treatment or prevention of hypertension, diabetes, osteoporosis, haemophilia, anaemia, cancer, migraine, or angina pectoris. Specifically they are used to deliver insulin or leuprolide, but many other suitable therapeutic agents are disclosed, including genes or inhibitory nucleic acid, imaging agents and antigens. (I) may also provide targeting to the GI tract. Other uses of (I) are: (I) to determine the level of specified receptors in a sample (in a binding assay): and (ii) to screen for molecules that bind (I).

Immunogenic analogues or derivatives of (I) are used to raise antibodies and in immunoassays. The antibodies are used to locate, detect and measure (I), e.g. for imaging, monitoring treatment, tissue analysis etc., also for peptide purification and immobilisation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

The gene and protein can be used to produce transgenic plants which have increased lipid metabolism and membrane fluidity, and therefore increased resistance to heat and/or cold shock, to alter the content of phytosterol or lecithin in grains and to identify potential herbicides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAH84373 to AAH84499 represent Escherichia coli growth and proliferation related DNA sequences (I). AAH84500 to AAH8670 encode the E. coli growth and proliferation related proteins given in AAG99078 and AAG9839 to AAG98999. (I) can be used as potential targets for the generation of new antimicrobial agents, and for identification of compounds which interact with the gene products of (I). In addition the expression of (I) and the purification of the proteins, the purified proteins can be used to generate reagents and screen small molecule libraries or other candidate compound libraries for compounds that can be further developed to yield novel antimicrobial compounds. In addition, nucleic acid probes complementary to (I) that are specific for particular species of microorganisms can be used to identify particular microorganism species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               E. coli growth and proliferation related protein sequence SEQ ID NO:345.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             in clinical specimens, therefore, providing a rapid and dependable method by which to identify the causative agents of a bacterial infection. Also, antibodies generated against proteins translated from mRNA transcribed from proliferation required sequences can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acids that inhibit Escherichia coli proliferation, useful for screening for homologous genes and for designing expression vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to screen for specific microorganisms that produce such proteins in a species-specific manner. AAHB4371 and AAHB4670 represent sequencing primers used in the isolation of E. coli growth and proliferation related sequence, which are used in an example from the present
                                                                                                                                                                                                  Gaps

                                                                                                                            qq
                                                                                                                                                                                                                The invention relates to a novel yeast G protein-coupled receptor,

C GPR1 (AAY58355). GPR1 is predicted to have seven transmembrane domains,

which is characteristic of G protein-coupled receptors, and also

contains a very large third cytoplasmic loop and a large cytoplasmic

sequence (RKRAQIO) is present at the N-terminal end of the loop and the

other sequence (KKRRAQIO) is at the C-terminal end of the loop and the

third cytoplasmic loop also contains an asparagine-rich region. GPR1 is

believed to provide the upstream signal that activates GPA2, and plays

an essential role in inducing the switch from non-filamentous to

filamentous growth in yeast. Modulators of GPR1 function, especially

inhibitors, are useful for prevention or treatment of a disease or

c disorder involving a fungal infection. The inhibitor may be an anti-GPR1

antibody, GPR1 antisense nucleic acid or a GPR1 gene altered so that an

contains a very large that the contains and integral acid or a GPR1 gene altered so that an

contains a very large that acid or a GPR1 gene altered so that an

contains a very large that acid or a GPR1 gene altered so that an antised the contains and a GPR1 gene altered so that an ancidence in activate the biological activity of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the Invention. This sequence is lacking the majority of the cytoplasmic C-terminal tall, relative to the native GPRI.
Note: This sequence is not shown in the specification, but is derived from the yeast GPRI amino acid sequence given in figure 1A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GPRI. Compounds which modulate GPRI gene expression and/or gene product activity may be used to inhibit the conversion of a fungus from a non-filamentous form to a filamentous form. The present sequence represents a GPR mutant, d277-284, used in an exemplification of

The invention relates to a novel yeast G protein-coupled receptor,

GPRI (AAY$855). GPRI is predicted to have seven transmembrane domains,
which is characteristic of G protein-coupled receptors, and also
contains a very large third cytoplasmic loop and a large cytoplasmic
sequence (KRRAQIO) is present at the N-terminal end of the loop and the
cytoplasmic loop also contains an asparagine-rich region. GPRI is
believed to provide the upstream signal that activates GPA2, and plays
an essential role in inducing the switch from non-filamentous to provide the waster and activates GPA2, and plays
an essential role in inducing the switch from non-filamentous to filamentous growth in yeast. Modulators of GPRI function, especially
inhibitors, are useful for prevention or treatment of a disease or
continody, GPRI antisense nucleic acid or a GPRI gene altered so that an
inserted heterologous sequence inactivates the biological activity of
confilamentous form to a filamentous form. The present sequence
confilamentous form to a filamentous form. The present sequence
crepresents a GPR mutant, 4377-284, used in an exemplification of
the invention. This sequence is lacking a portion (designated the
                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: This sequence is not shown in the specification, but is derived from the yeast GPR1 amino acid sequence given in figure 1A.
                                                                           Gaps

The Invention relates to a novel yeast G protein-coupled receptor, GPRI (AAY58355). GPRI is predicted to have seven transmembrane domains, which is characteristic of G protein-coupled receptors, and also contains a very large third cytoplasmic loop and a large cytoplasmic tall. The third cytoplasmic loop contains two short basic sequences; one sequence (KRKRAQIG) is present at the N-terminal end of the loop and the other sequence (KKRRAQIO) is at the C-terminal end of the loop and the third cytoplasmic loop also contains an asparagine-rich region. GPRI is believed to provide the upstream signal that activates GPA2, and plays an essential role in inducing the switch from non-filamentous to filamentous growth in yeast. Modulators of GPRI function, especially inhibitors, are useful for prevention or treatment of a disease or disorder involving a fungal infection. The inhibitor may be an anti-GPRI antisense nucleic acid or a GPRI gene altered so that an inserted heterologous sequence inactivates the biological activity of GPRI. Compounds which modulate GPRI gene expression and/or gene product activity may be used to inhibit the conversion of a fungus from a Note: This sequence is not shown in the specification, but is derived from the yeast GPR1 amino acid sequence given in figure 1A. non-filamentous form to a filamentous form. The present sequence represents a GPR mutant, d277-284, used in an exemplification of the invention. This sequence is lacking the asparagine-rich region of the third cytoplasmic loop, relative to the native GPR1. 864 AA; Sequence Note:

The invention relates to a novel yeast G protein-coupled receptor, CPRI (AAY5835). GPRI is predicted to have seven transmembrane domains, which is characteristic of G protein-coupled receptors, and also contains a very large third cytoplasmic loop and a large cytoplasmic contains a very large third cytoplasmic loop and a large cytoplasmic contains two short basic sequences; one sequence (KRKRAQIG) is present at the N-terminal end of the loop and the cother sequence (KRRRAQIG) is at the C-terminal end of the loop. The third cytoplasmic loop also contains an asparagine-rich region. GPRI is believed to provide the upstream signal that activates GPAZ, and plays an essential role in inducing the switch from non-filamentous to filamentous growth in yeast. Modilators of GPRI function, especially inhibitors, are useful for prevention or treatment of a disease or disorder involving a fungal infection. The inhibitor may be an anti-GPRI antibody, GPRI antisense nucleic acid or a GPRI gene altered so that an inserted heterologous sequence inactivates the biological activity of activity may be used to inhibit the conversion of a fungus from a non-filamentous form to a filamentous form. The present sequence conversion of a fungus from a non-filamentous form to a filamentous form. The present sequence is lacking the first basic motif (KRIKAQIG) of the third cytoplasmic loop, realative to the native GPRI.

Note: This sequence is not shown in the specification, but is derived from the yeast GPRI amino acid sequence given in figure 1A. ö Gaps Yeast; G protein-coupled receptor; GPR1; filamentous growth; pseudohyphal form; signalling pathway; antifungal; mutant; mutein. ö identifying modulators and inhibitors useful as anti-fungals Score 30; DB 21; Length 864; Pred. The invention relates to a novel yeast G protein-coupled receptor,

C GPR1 (AAY58355). GPR1 is predicted to have seven transmembrane domains,

Which is characteristic of G protein-coupled receptors, and also

contains a very large third cytoplasmic loop and a large cytoplasmic

tail. The third cytoplasmic loop contains two short basic sequences; one

sequence (KKRRAQIO) is present at the N-terminal end of the loop and the

cytoplasmic loop also contains an asparagine-rich region. GPR1 is

chird cytoplasmic loop also contains an asparagine-rich region. GPR1 is

believed to provide the upstream signal that activates GPR2, and plays

an essential role in Inducting the switch from non-filamentous to

filamentous growth in yeast. Modulators of GPR1 function, especially

inhibitors, are useful for prevention or treatment of a disease or

disorder involving a fungal infection. The inhibitor may be an anti-GPR1

chaptody, GPR1 antisense nucleic acid or a GPR1 gene altered so that an

inserted heterologous sequence inactivates the biological activity of

GPR1. Compounds which modulate GPR1 gene expression and/or gene product

cactivity may be used to inhibit the conversion of a fungus from a

non-filamentous form to a filamentous form. The present sequence

crepresents a GPR mutant, d610-617, used in an exemplification of

the invention. This sequence is lacking the second basic modif

(KKRRAQIO) of the third cytoplasmic loop, relative to the native GPR1.

This sequence represents a novel yeast G protein-coupled receptor,
GPR1. GPR1 is predicted to have seven transmembrane domains.
which is characteristic of G protein-coupled receptors, and also
contains a very large third cytoplasmic loop and a large cytoplasmic
sequence (KRIKAOIG) is present at the N-terminal end of the loop and the
other sequence (KRIRAOIG) is at the C-terminal end of the loop and the
other sequence (KRIRAOIG) is at the C-terminal end of the loop and the
other sequence (KRIRAOIG) is at the C-terminal end of the loop and the
cother sequence (KRIRAOIG) is at the C-terminal end of the loop and the
cother sequence (KRIRAOIG) is at the San asparagine-rich region. GPR1 is
believed to provide the upstream signal that activates GPR2, and plays
an essential role in inducing the switch from non-filamentous to
filamentous growth in yeast. Modulators of GPR1 function, especially
inhibitors, are useful for prevention or treatment of a disease or
disorder involving a fungal infection. The inhibitor may be an anti-GPR1
antibody, GPR1 antisense nucleic acid or a GPR1 gene altered so that an
instruct of Compounds sequence inactivates the biological activity of
activity may be used to inhibit the conversion of a fungus from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     *encoded by predicted reading frame a, x's in the sequence indicate stop codons in the reading frame"

This invention describes a novel avian-paramyxovirus cDNA (I) which comprises a nucleic acid sequence corresponding to the 5' terminal end of the genome of avian-paramyxovirus allowing the generation of an infectious copy of avian-paramyxovirus. The cell line is useful for the production of infectious lentogenic NDV (Newcastle Disease virus) without the addition of exagenous proteolytic activity. Also it is obscible to generate a stable transfected cell line that expresses the wild-type F protein in the virus envelope therefore providing infectious particles, useful in the form of a vaccine, especially against respiratory and/or gastrointestinal diseases. NDV can be easily cultured to very high titers in embryonated eggs. Mass culture of embryonated eggs is relatively cheap. NDV vaccines are relatively stable and can be eggs is relatively cheap. NDV vaccines are relatively stable and can be simply administered by mass application methods e.g. drinking water or by spraying or by aerosol formation. The natural route of infection is by the respiratory and/or gastrointestinal tract which are also the major
                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New avian paramyxovirus cDNA, useful for production of vaccine against
Newcastle disease virus
                                                                                                                                                                                                                                                                                                         Gaps
                                     DNA sequence of myotonic dystrophy gene - used to produce probes and identify CHR 19 abnormality and protein kinase responsible

AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB53234 to AAB54006. The human colon cancer antigens can have cytostatic, cardidoactive, muscular; human colon cancer antigens can be used in gene therapy. The colon cancer antigen polynucleotides, can be used in gene therapy. The colon cancer antigen polynucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polynucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune system disorders, muds, renal disorders, infectious diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAC98707 represent sequences used in the exemplification of the present
                                                                                                                                                                                            ö
routes of infection of many other poultry pathogens. NDV can induce local immunity despite the presence of circulating maternal antibody. This sequence represents a protein encoded by the NDV strain LaSota genome which is described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Colon cancer associated gene sequences, referred to as colon cancer antigens, useful for the treatment, prevention, and diagnosis of colon disorders such as colon cancer

Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary strand of a polynucleotide which comprises of 5 end complementary strand of a polynucleotide which comprises a 5 end sequence and an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5 end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          polynucleotide which comprises a 3' end sequence, where the obliganceleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03166 to AAH13628 and AAH13633 to AAH18742 represent human cDNA sequences; AAB92446 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
